Abstract:
We have developed methods which can deal with the user's interaction without conventional conscious searching. When a user generally performs map operations with certain information retrieval intentions (less-conscious), a system using our method can detect the specific operation sequences. For example, if the user performs zooming-in and centering operations, the user is narrowing down the search area to a certain location. We define such operation sequences as chunks. The system detects the chunks and uses them to analyze the user's operations and thereby detect the user's intentions. We have developed several prototype systems based on the proposed methods.

Bio:
Professor Sumiya is a faculty member at the Information Media Laboratory, School of Human Science and Environment, University of Hyogo, Japan. He is a member of the Association for Computing Machinery (ACM) and IEEE Computer Society. He is also the Chair of Database System special interest group (SIGDBS), Information Processing Society of Japan (IPSJ), and co-editor of IPSJ Transaction on Database. His current research interests include extracting intention and analyzing credibility in geographical information retrieval, modified maps, geographical recommendation systems, and monitoring geo-social activities via microblogs.
